If Diablo Canyon is to be stopped, it is the people who must do it. The NRC has never refused an operating license for a nuclear power plant. Despite major design problems and the existence of the Hosgri fault just 2.5 miles offshore, the Nuclear Regulatory Commission (NRC) remains committed to licensing the plant.

The licensing of Diablo Canyon is another example of the federal government and private industry promoting nuclear technology without regard for the people who will be affected by it. If we fail to respond strongly to this emergency, we will be telling the nuclear industry that it can build and operate a plant like Diablo anywhere. We must continue to oppose this threat to our health and environment.

A History of Successful Resistance

For the past 10 years, people have been working to prevent the operation of Diablo Canyon. The plant is still not operating, and is in fact 9 years behind schedule. The resistance has incorporated many different tactics, including legal intervention, letter writing, lobbying, educational forums, marches, rallies and civil disobedience. The Abalone Alliance began its opposition to Diablo in 1977 and has utilized many forms of nonviolent direct action. Thousands of people participated in the 1981 Diablo Canyon Blockade/Encampment, which proved to be an empowering response to the insanity of licensing a nuclear plant on an active earthquake fault.
