

# Elucidating the Mechanism of ADEP Resistance in *Streptomyces coelicolor*

Patrice V. Groomes, Corey L. Compton, Jason K. Sello

Department of Chemistry, Brown University, 324 Brook Street, Providence, RI 02912

## BACKGROUND

### Drug Resistance in *Mycobacterium tuberculosis*

*Mycobacterium tuberculosis*, the causative agent of tuberculosis, is a pathogen that affects more than one third of the world's population.

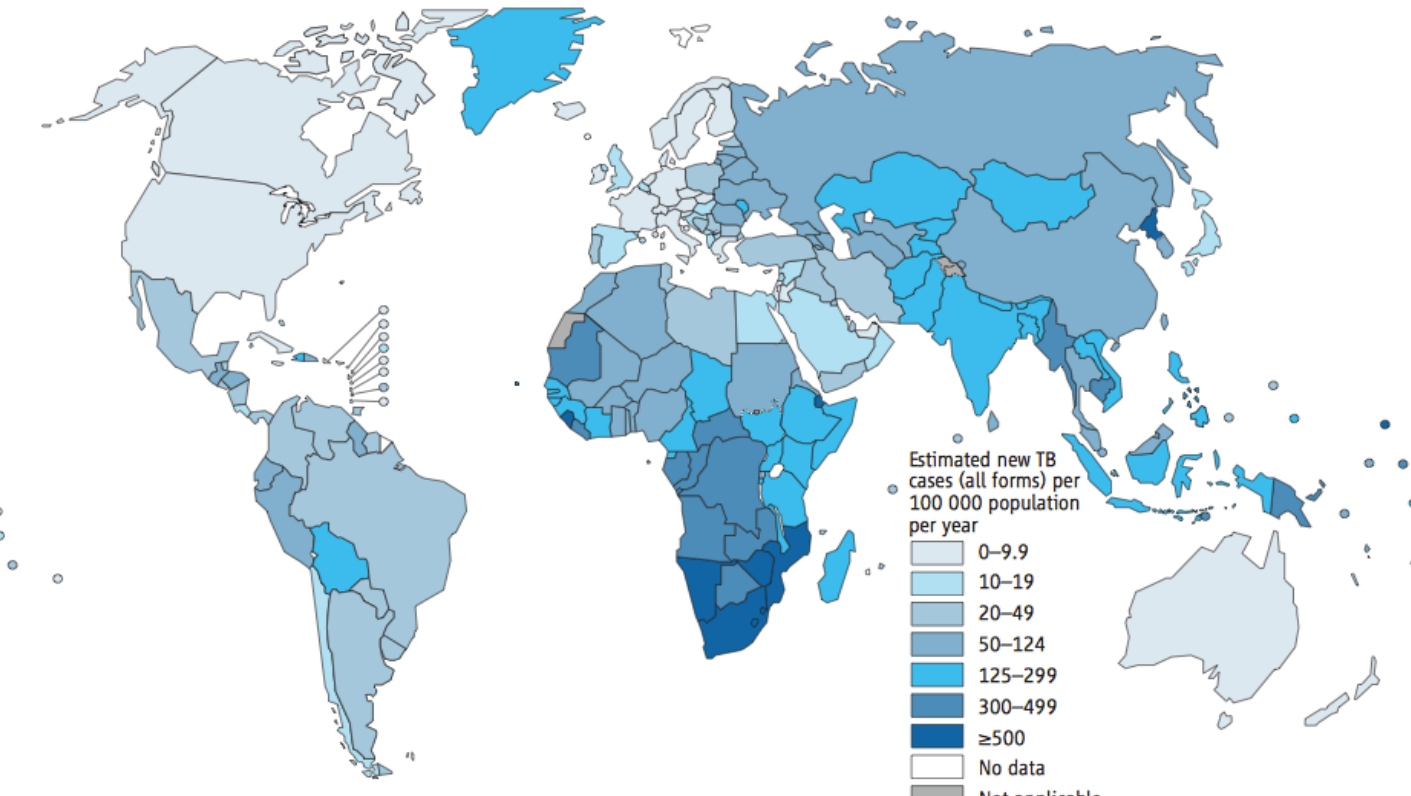

Figure 1: Estimated TB Incidence Rates, 2012<sup>1</sup>

- Many of the drugs previously effective against the bacterium are no longer useful due to increasing antibiotic resistance.
- New antibacterial agents are thus needed to combat infection

### Synthetic Cyclic Acyldepsipeptides (ADEPs) are a powerful new way to attack drug resistant strains

Acyldepsipeptides (ADEPs) cause unregulated protein degradation in bacteria by targeting the ClpP peptidase.

Figure 2: ADEP 1A

ADEPs have been shown to be more effective in *M. tuberculosis* when co-administered with efflux pump inhibitors<sup>2</sup>, implicating a mechanism of efflux for resistance

Figure 3: A proposed mechanism of ADEP resistance in *M. tuberculosis* and *Streptomyces coelicolor*

### *Streptomyces coelicolor* is a model organism for *M. tuberculosis*

- The efflux pump responsible for ADEP resistance in *M. tuberculosis* has yet to be characterized
- Because *Streptomyces coelicolor* is non-pathogenic, easily genetically manipulated, and grows faster than *M. tuberculosis*, it is an ideal model organism for laboratory experiments.

### The Identification of the Efflux Pump Responsible for ADEP Resistance in *Streptomyces coelicolor*

Bioinformatic analyses have implicated that an ABC-type transporter is involved in ADEP resistance<sup>3</sup>

- *sco1719* and *sco1720* are two genes in *S. coelicolor* that encode a promising ABC transporter candidate for the extrusion of ADEPs
- *sco1718* is hypothesized to encode its regulator, likely a repressor of the pump

Figure 4: The genetic locus thought to encode the efflux pump responsible for ADEP resistance and its regulator

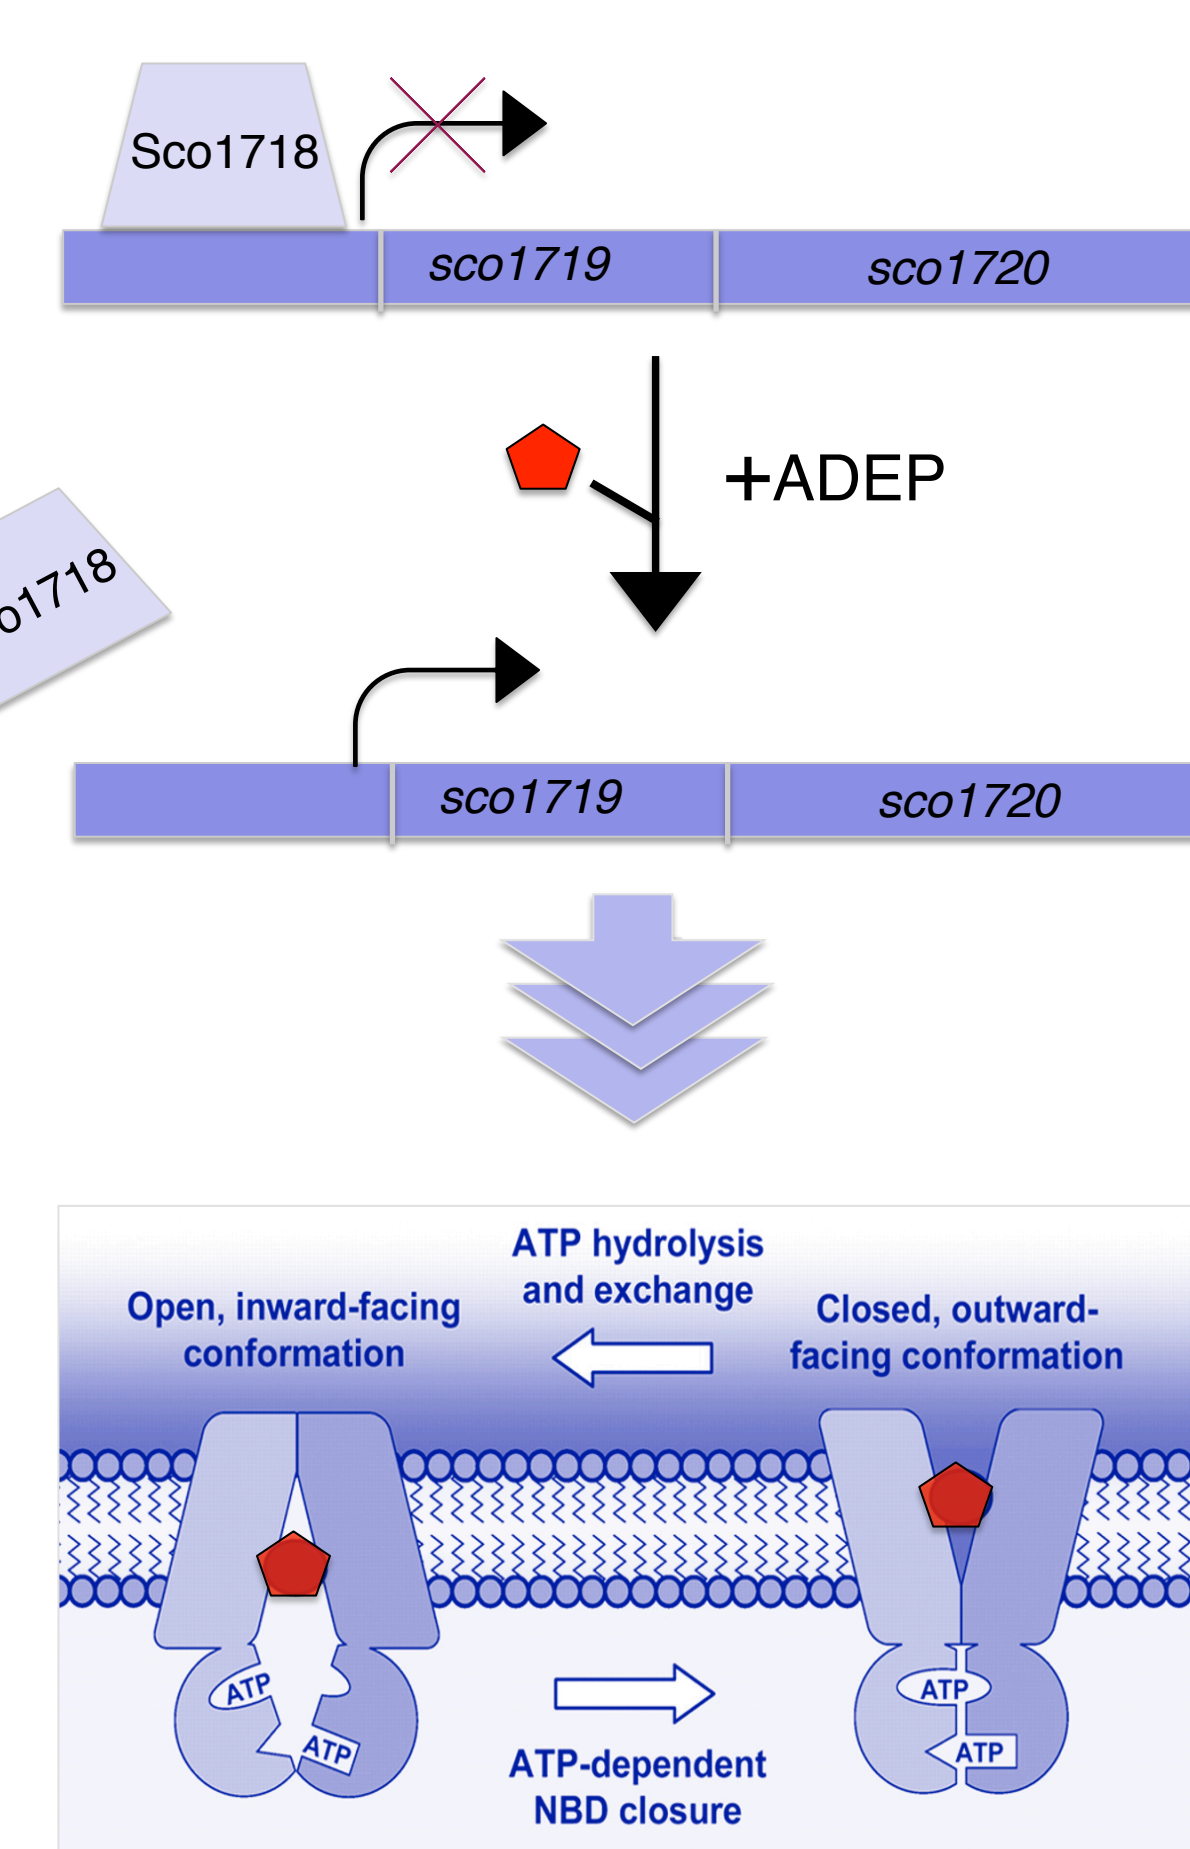

Figure 5: Predicted mechanism of efflux regulation

### Creation of *S. coelicolor* Strains Over-expressing Either *sco1718* or *sco1719-20*

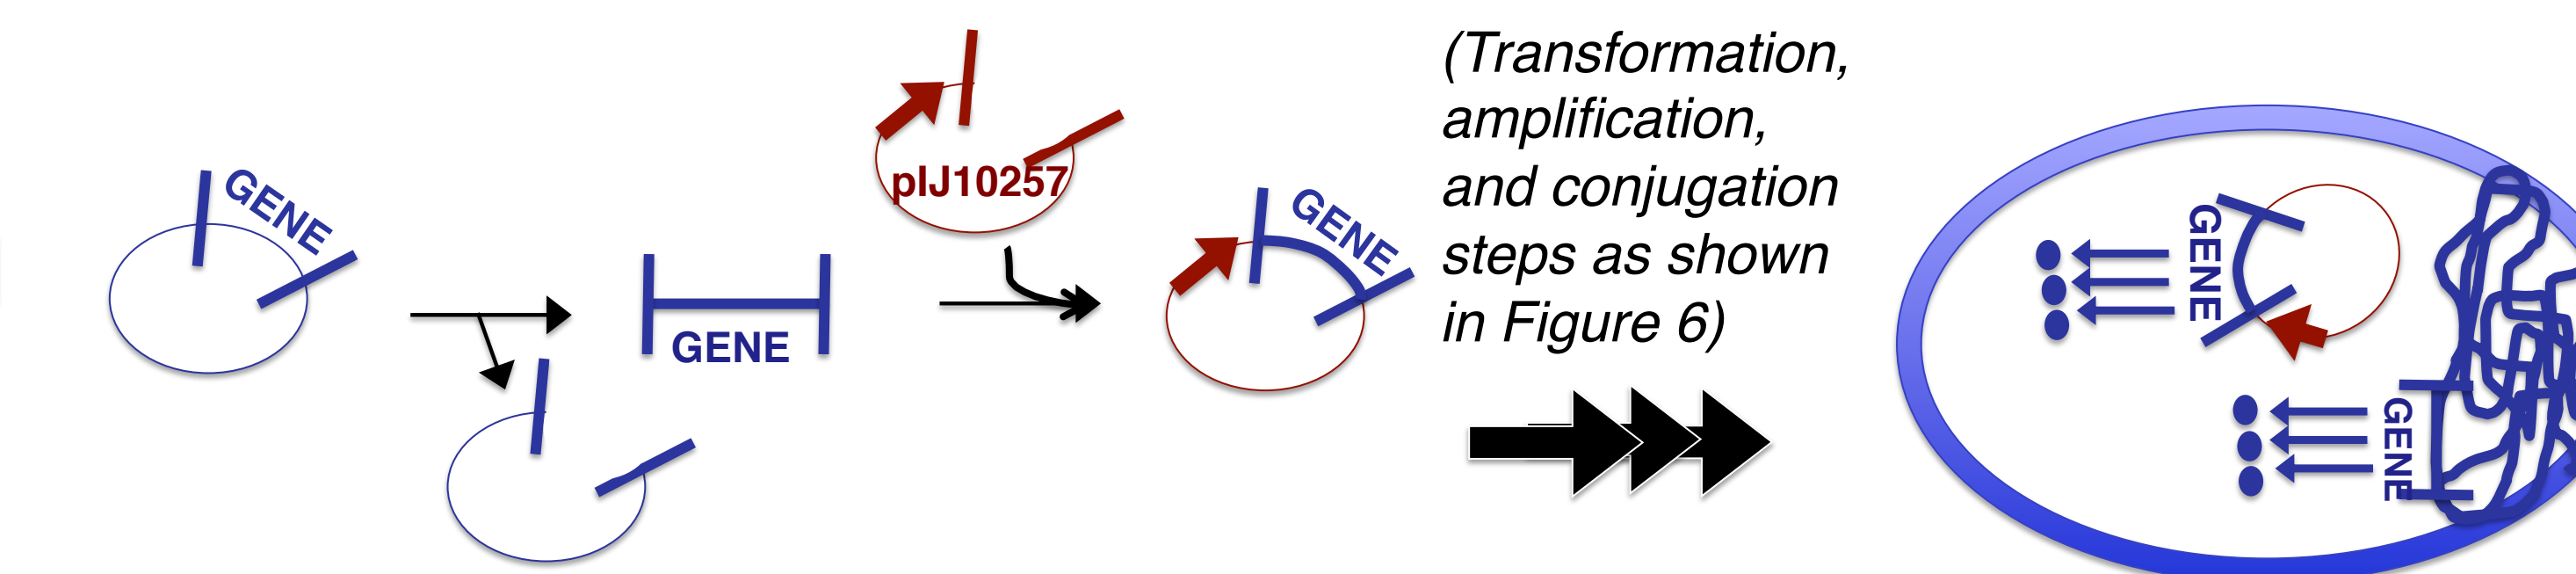

Figure 7: The creation of *sco1718* and *sco1719-20* overexpression strains (Transformation, amplification, and conjugation steps as shown in Figure 6)

## RESULTS

### Confirmation of Gene Knockouts and Overexpression Constructs via Restriction Analyses

Figure 8: Analytical digests of WT and null strain genomic DNA in the region of gene replacement

## EXPERIMENTAL DESIGN

### Generation of *S. coelicolor* Strains Lacking either *sco1718* or *sco1719-20*<sup>4</sup>

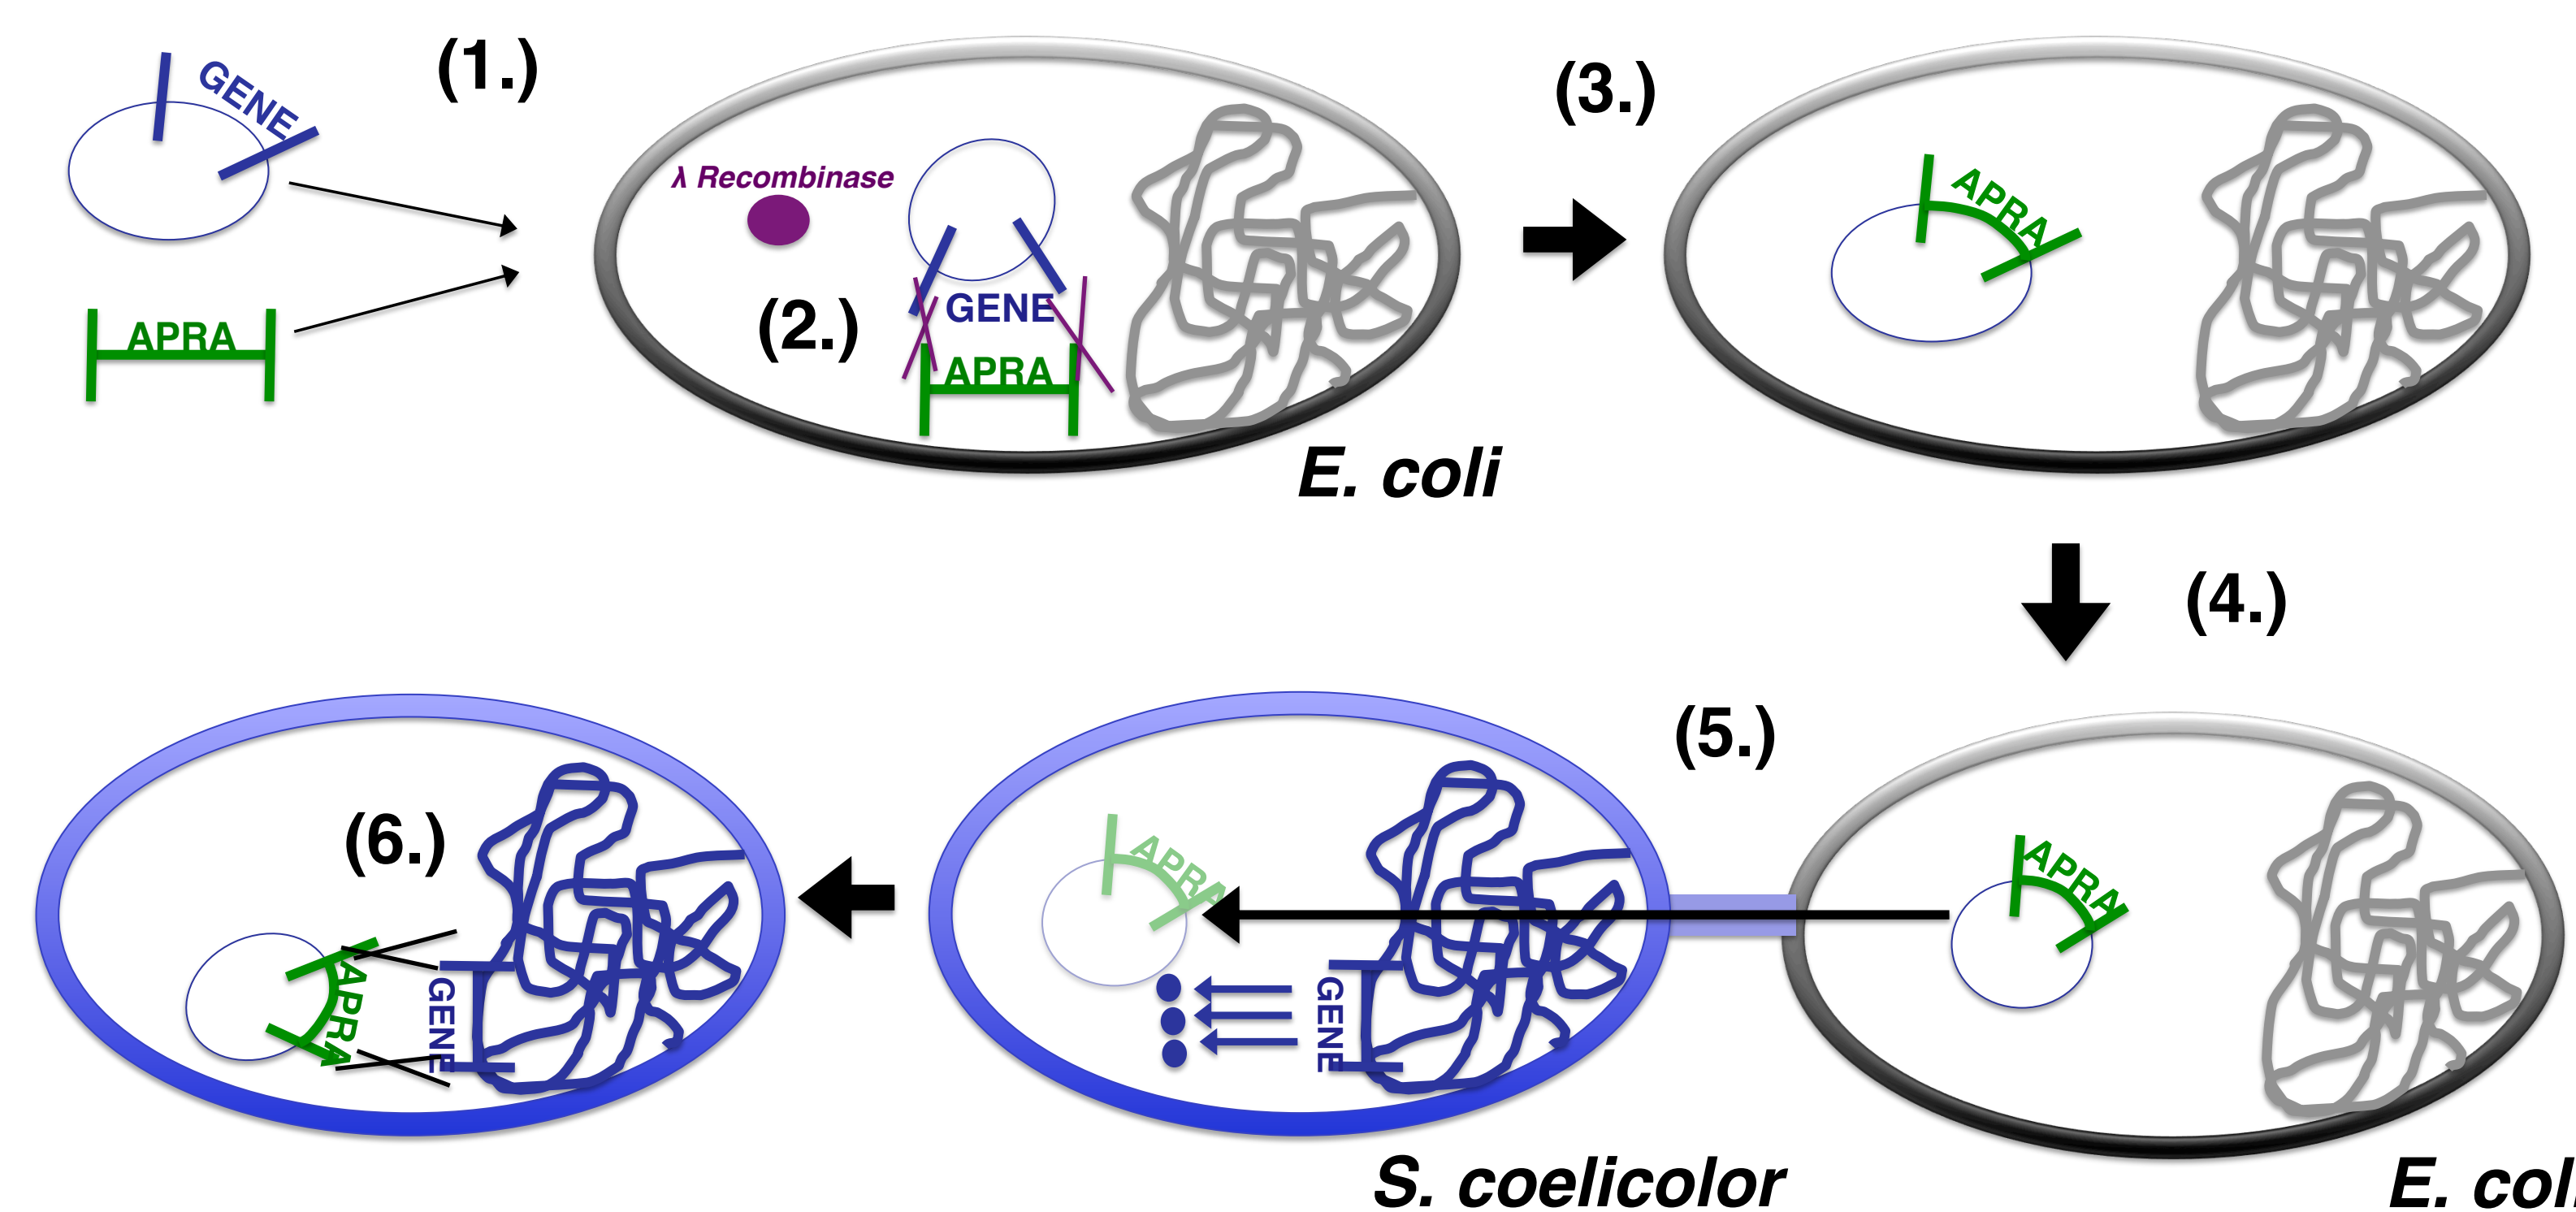

Figure 6: The generation of  $\Delta$ *sco1718::apr* and  $\Delta$ *sco1719-20::apr* null strains

- 1.) Transformation of *S. coelicolor* cosmid with gene of interest and PCR-amplified *apr* cassette into *E. coli* expressing  $\lambda$  recombinase
- 2.) Homologous recombination
- 3.) 30°C → 37°C to lose temperature sensitive  $\lambda$  recombinase plasmid
- 4.) Transformation and amplification in conjugation *E. coli* strain
- 5.) Conjugation into *S. coelicolor*
- 6.) Homologous recombination and gene silencing

### ADEP Susceptibilities of WT and Null Strains of *S. coelicolor*

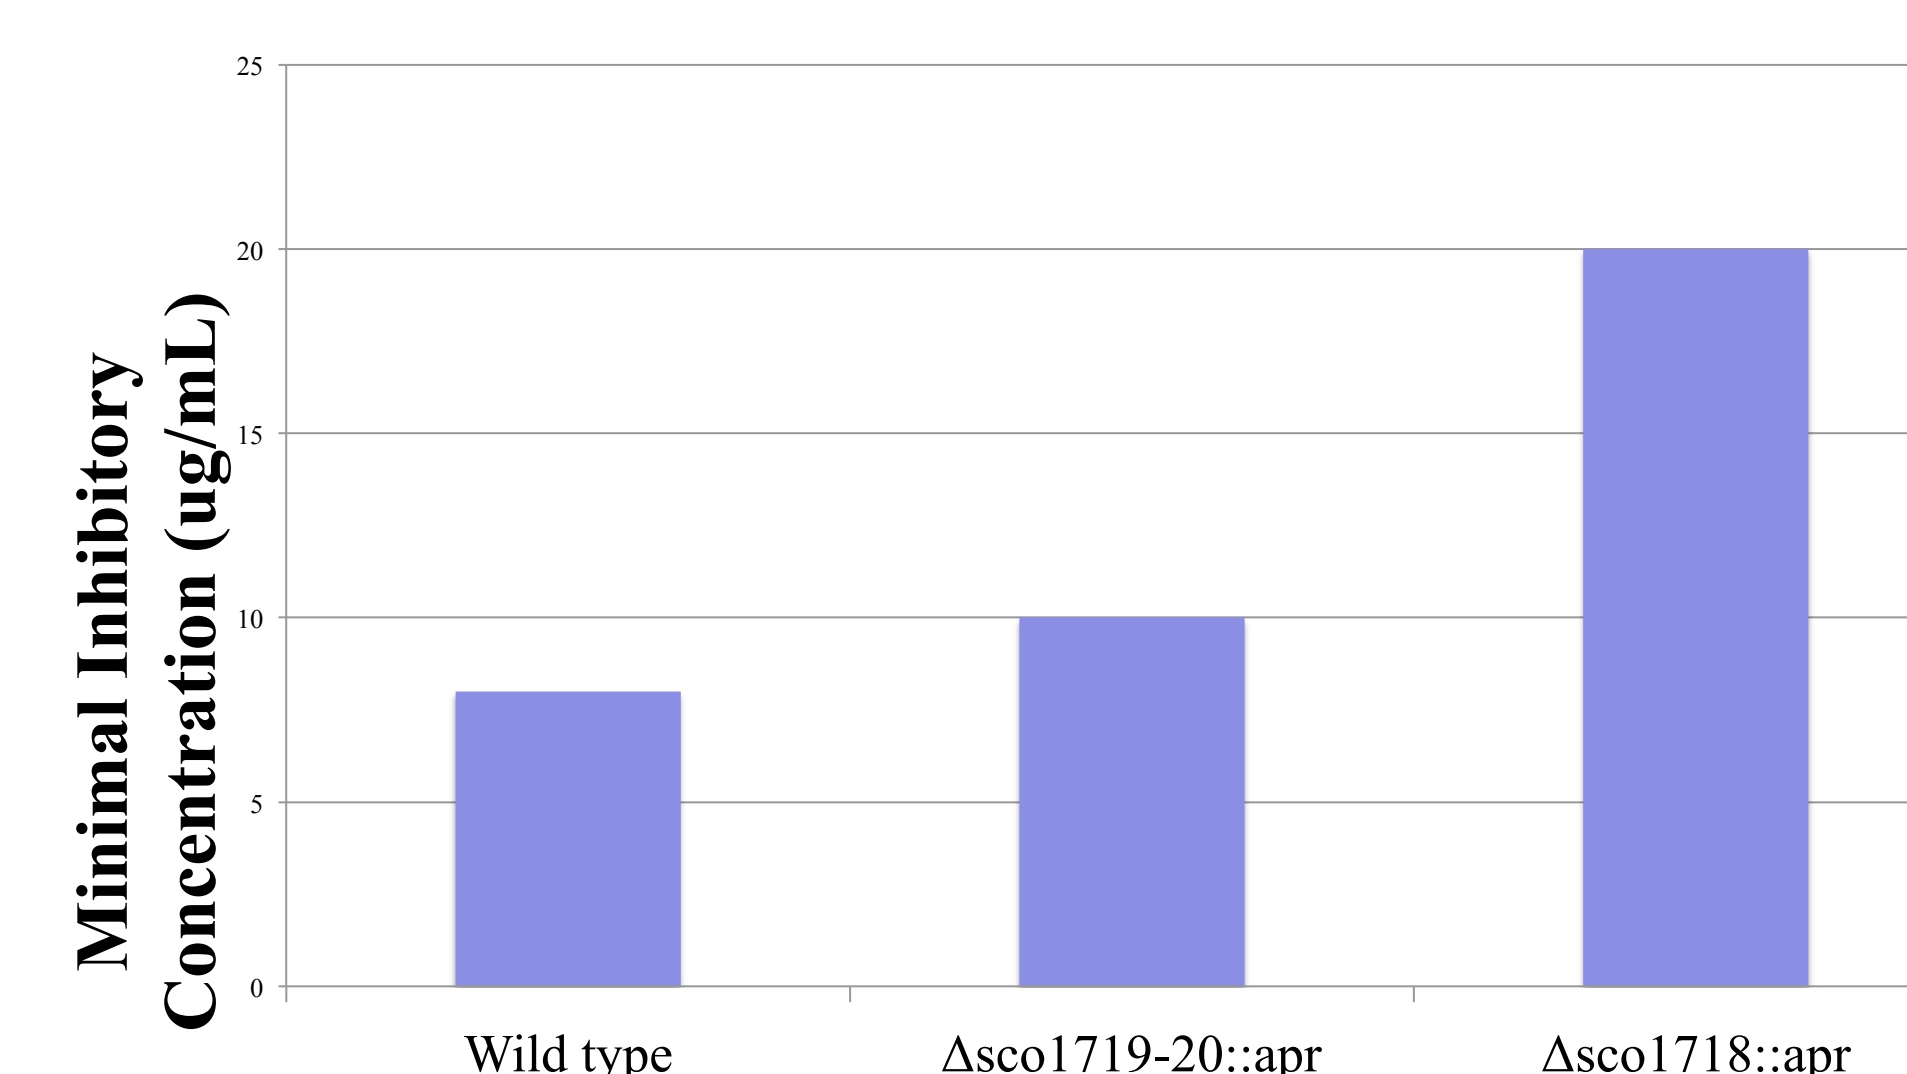

Figure 9: Minimal Inhibitory Concentrations of ADEPs against *S. coelicolor* WT and null strains

## FUTURE DIRECTIONS

- MIC testing of overexpression strains
- MIC testing with efflux pump inhibitors
- Further analysis of *Sco1718* regulatory role (RT-PCR, electrophoretic mobility shift assays, etc.)
- Testing against other antibiotics
