## **PROJECT SUMMARY**

This report includes the preliminary results of analysis for eleven samples of Johnson's Baby Powder. The samples were delivered to Materials Analytical Services, LLC from Lanier and Kazan Law Firms over a period of seven months from August 1, 2016 through March 8, 2017. Samples were assigned MAS laboratory identification numbers and are listed below in the Description of Samples section. A sub-sample from each bottle was examined by transmission electron microscopy (TEM), selected area electron diffraction (SAED), and energy dispersive x-ray spectroscopy (EDXA) for the presence of fibrous amphiboles.

## **DESCRIPTION OF SAMPLES**

<b><u>MAS No.</u></b>	<b><u>Description</u></b>
M65205-001	Johnson's Baby Powder.
M65208-001	Johnson's Baby Powder.
M65228-001	Johnson's Baby Powder.
M65329-013	15 oz. bottle Johnson's Baby Powder.
M65329-041	4.5 oz. can Johnson's Baby Powder.
M65329-043	Johnson's Baby Powder.
M66173-001	Johnson's Baby Powder.
M66173-002	Johnson's Baby Powder.
M66173-003	10.0 oz. bottle Johnson's Baby Powder.
M66352-001	9 oz. bottle Johnson's Baby Powder.
M66352-002	1.5 oz. bottle Johnson's Baby Powder.

\*See Figures 1-7 for photos of individual Johnson's Baby Powder Product.

## **PREPARATION AND ANALYSIS**

The samples were removed from the package as received, labeled with the MAS tracking numbers, and prepped for TEM Analysis. Characterization of asbestiform structures in each sample was done using a Jeol-1200EX 100 kV transmission electron microscope (TEM) equipped with a Noran energy dispersive x-ray (EDXA) analysis system. All asbestiform fibrous structures were analyzed by morphology, Energy dispersive x-ray (EDXA), selected area electron diffraction (SAED), and sized by both length and width. Only identified amphibole structures that were greater than 0.5  $\mu\text{m}$  in length and met the EPA Level II definition of either a fiber or bundle (parallel sides) with at least a 5 to 1 aspect ratio were counted. At the same time the samples were prepared, a laboratory blank sample was also prepared and analyzed using the same procedures.

## **RESULTS**

The TEM analysis of the eleven Johnson's Baby Powder samples showed that 8 of the 11 samples contained amphibole structures. Sample M65205-001 had 101 amphibole structures identified as tremolite. The tremolite concentration is 15,100,000 structures per gram of material (Table 1). The size range of tremolite was between 2  $\mu\text{m}$  to 18  $\mu\text{m}$  with an average aspect ratio (length to width) of 11.1 to 1 (Table 2).

Sample M65208-001 had 10 amphibole structures identified as tremolite. The tremolite concentration is 376,000 structures per gram of material (Table 1). The size range of tremolite was between 3.2  $\mu\text{m}$  to 13.5  $\mu\text{m}$  with an average aspect ratio (length to width) of 10.4 to 1 (Table 3).

Sample M65228-001 had 5 amphibole structures; 4 were identified as tremolite, 1 was identified as richterite. The tremolite concentration is 356,000 structures per gram of material (Table 1). The size range of tremolite was between 3.0  $\mu\text{m}$  to 8.0  $\mu\text{m}$  with an average aspect ratio (length to width) of 7.9 to 1 (Table 4).

Sample M65329-041 had 18 amphibole structures identified as tremolite. The tremolite concentration is 1,390,000 structures per gram of material (Table 1). The size range of tremolite was between 2.35  $\mu\text{m}$  to 11.35  $\mu\text{m}$  with an average aspect ratio (length to width) of 11.1 to 1 (Table 5).

Sample M65329-043 had 12 amphibole structures identified as tremolite. The tremolite concentration is 1,090,000 structures per gram of material (Table 1). The size range of tremolite was between 2.2  $\mu\text{m}$  to 36  $\mu\text{m}$  with an average aspect ratio (length to width) of 9.0 to 1 (Table 6).

Sample M66173-002 had 10 amphibole structures identified as tremolite. The tremolite concentration is 334,000 structures per gram of material (Table 1). The size range of tremolite was between 2.0  $\mu\text{m}$  to 24.8  $\mu\text{m}$  with an average aspect ratio (length to width) of 7.9 to 1 (Table 7).

Sample M66173-003 had 74 amphibole structures identified as tremolite. The tremolite concentration is 4,120,000 structures per gram of material (Table 1). The size range of tremolite was between 1.5  $\mu\text{m}$  to 20.2  $\mu\text{m}$  with an average aspect ratio (length to width) of 11.7 to 1 (Table 8).

Sample M66352-002 had 1 amphibole fiber identified as tremolite. The tremolite concentration is 17,200 structures per gram of material (Table 1). The aspect ratio (length to width) is 8.8 to 1 (Table 9).
